

TPA3110D2 15-W Filter-Free Stereo Class-D Audio Power Amplifier With SpeakerGuard™

1 Features

- 15-W/ch into an 8-Ω Loads at 10% THD+N From a 16-V Supply
- 10-W/ch into 8-Ω Loads at 10% THD+N From a 13-V Supply
- 30-W into a 4-Ω Mono Load at 10% THD+N From a 16-V Supply
- 90% Efficient Class-D Operation Eliminates Need for Heat Sinks
- Wide Supply Voltage Range Allows Operation From 8 V to 26 V
- Filter-Free Operation
- SpeakerGuard™ Speaker Protection Includes Adjustable Power Limiter Plus DC Protection
- Flow Through Pin Out Facilitates Easy Board Layout
- Robust Pin-to-Pin Short Circuit Protection and Thermal Protection With Auto Recovery Option
- Excellent THD+N / Pop-Free Performance
- Four Selectable, Fixed Gain Settings
- Differential Inputs

2 Applications

- Televisions
- Consumer Audio Equipment

3 Description

The TPA3110D2 is a 15-W (per channel) efficient, Class-D audio power amplifier for driving bridged-tied stereo speakers. Advanced EMI Suppression Technology enables the use of inexpensive ferrite bead filters at the outputs while meeting EMC requirements. SpeakerGuard™ speaker protection circuitry includes an adjustable power limiter and a DC detection circuit. The adjustable power limiter allows the user to set a "virtual" voltage rail lower than the chip supply to limit the amount of current through the speaker. The DC detect circuit measures the frequency and amplitude of the PWM signal and shuts off the output stage if the input capacitors are damaged or shorts exist on the inputs.

The TPA3110D2 can drive stereo speakers as low as 4 Ω. The high efficiency of the TPA3110D2, 90%, eliminates the need for an external heat sink when playing music.

The outputs are also fully protected against shorts to GND, VCC, and output-to-output. The short-circuit protection and thermal protection includes an auto-recovery feature.

Device Information⁽¹⁾

| PART NUMBER | PACKAGE | BODY SIZE (NOM) |
|-------------|-------------|-------------------|
| TPA3110D2 | HTSSOP (28) | 9.70 mm x 4.40 mm |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

| Changes from Revision E (November 2015) to Revision F | Page |
|---|-------------|
| • Added Measurement note added to characterization graphs | 10 |
| • Added New Output Power vs Supply Voltage Characterization graph | 10 |
| • Added footnote for heatsink and EVM | 14 |

| Changes from Revision D (July 2012) to Revision E | Page |
|--|-------------|
| • Added <i>Pin Configuration and Functions</i> section, <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section | 1 |

| Changes from Revision C (August 2010) to Revision D | Page |
|---|-------------|
| • Added < 10 V/ms to V _I in the Absolute Maximum Ratings table, added Note 2 | 5 |
| • Changed the PBTL Select section. Added text - "The voltage slew.....series with the terminals." | 19 |
| • Added a 100kΩ resistor to AVCC Pin 14 and Note 1 to Figure 46 | 24 |

| Changes from Revision B (July 2010) to Revision C | Page |
|--|-------------|
| • Replaced the Dissipations Ratings table with the Thermal Information table | 6 |

| Changes from Revision A (July 2009) to Revision B | Page |
|--|-------------|
| • Added slew rate adjustment information | 17 |
| • Added AVCC to Pin 7 of Figure 46 | 24 |

Changes from Original (July 2009) to Revision A**Page**

-
- Changed Changed the Stereo Class-D Amplifier with BTL Output and Single-Ended Input illustration [Figure 42](#) -
Corrected the pin names. 21
 - Changed Changed the Stereo Class-D Amplifier with PBTL Output and Single-Ended Input illustration [Figure 46](#) -
Corrected the pin names. 24

5 Device Comparison Table

| DEVICE NUMBER | SPEAKER CHANNELS | SPEAKER AMP TYPE | OUTPUT POWER (W) | ADDITIONAL FEATURES |
|---------------|------------------|------------------|------------------|---------------------|
| TPA3110D2 | Stereo | Class D | 15 | Power limiter |
| TPA3130D1 | Stereo | Class D | 15 | |
| TPA3118D2 | Stereo | Class D | 30 | Power limiter |
| TPA3116D1 | Stereo | Class D | 50 | Power limiter |

6 Pin Configuration and Functions

PWP Package
28-Pin HTSSOP With PowerPAD™
Top View

Table 1. Pin Functions

| NO. | PIN | | TYPE | DESCRIPTION |
|-----|-----|--------------------|------|--|
| | | NAME | | |
| 1 | | \overline{SD} | I | Shutdown logic input for audio amp (LOW = outputs Hi-Z, HIGH = outputs enabled). TTL logic levels with compliance to AVCC. |
| 2 | | \overline{FAULT} | O | Open drain output used to display short circuit or dc detect fault status. Voltage compliant to AVCC. Short circuit faults can be set to auto-recovery by connecting \overline{FAULT} pin to \overline{SD} pin. Otherwise, both short circuit faults and dc detect faults must be reset by cycling PVCC. |
| 3 | | LINP | I | Positive audio input for left channel. Biased at 3 V. |
| 4 | | LINN | I | Negative audio input for left channel. Biased at 3 V. |
| 5 | | GAIN0 | I | Gain select least significant bit. TTL logic levels with compliance to AVCC. |
| 6 | | GAIN1 | I | Gain select most significant bit. TTL logic levels with compliance to AVCC. |
| 7 | | AVCC | P | Analog supply |
| 8 | | AGND | — | Analog signal ground. Connect to the thermal pad. |
| 9 | | GVDD | O | High-side FET gate drive supply. Nominal voltage is 7V. Also should be used as supply for PLIMIT function. |
| 10 | | PLIMIT | I | Power limit level adjust. Connect a resistor divider from GVDD to GND to set power limit. Connect directly to GVDD for no power limit. |
| 11 | | RINN | I | Negative audio input for right channel. Biased at 3 V. |
| 12 | | RINP | I | Positive audio input for right channel. Biased at 3 V. |
| 13 | | NC | — | Not connected |
| 14 | | PBTL | I | Parallel BTL mode switch |

Table 1. Pin Functions (continued)

| PIN | | TYPE | DESCRIPTION |
|-----|-------|------|---|
| NO. | NAME | | |
| 15 | PVCCR | P | Power supply for right channel H-bridge. Right channel and left channel power supply inputs are connect internally. |
| 16 | PVCCR | P | Power supply for right channel H-bridge. Right channel and left channel power supply inputs are connect internally. |
| 17 | BSPR | I | Bootstrap I/O for right channel, positive high-side FET. |
| 18 | OUTPR | O | Class-D H-bridge positive output for right channel. |
| 19 | PGND | — | Power ground for the H-bridges. |
| 20 | OUTNR | O | Class-D H-bridge negative output for right channel. |
| 21 | BSNR | I | Bootstrap I/O for right channel, negative high-side FET. |
| 22 | BSNL | I | Bootstrap I/O for left channel, negative high-side FET. |
| 23 | OUTNL | O | Class-D H-bridge negative output for left channel. |
| 24 | PGND | — | Power ground for the H-bridges. |
| 25 | OUTPL | O | Class-D H-bridge positive output for left channel. |
| 26 | BSPL | I | Bootstrap I/O for left channel, positive high-side FET. |
| 27 | PVCLL | P | Power supply for left channel H-bridge. Right channel and left channel power supply inputs are connect internally. |
| 28 | PVCLL | P | Power supply for left channel H-bridge. Right channel and left channel power supply inputs are connect internally. |

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

| | | | MIN | MAX | UNIT |
|------------------------------------|---|---|---|-------------------------|------|
| V _{CC} | Supply voltage | AVCC, PVCC | −0.3 V | 30 V | V |
| V _I | Interface pin voltage | \overline{SD} , GAIN0, GAIN1, PBTL, \overline{FAULT} ⁽²⁾ | −0.3 V | V _{CC} + 0.3 V | V |
| | | PLIMIT | −0.3 | GVDD + 0.3 | V |
| | | RINN, RINP, LINN, LINP | −0.3 | 6.3 | V |
| Continuous total power dissipation | | | See Thermal Information | | |
| R _L | Minimum Load Resistance | BTL: PVCC > 15 V | 4.8 | | |
| | | BTL: PVCC ≤ 15 V | 3.2 | | |
| | | PBTL | 3.2 | | |
| T _A | Operating free-air temperature | −40 | 85 | °C | |
| T _J | Operating junction temperature range ⁽³⁾ | −40 | 150 | °C | |
| T _{stg} | Storage temperature | −65 | 150 | °C | |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The voltage slew rate of these pins must be restricted to no more than 10 V/ms. For higher slew rates, use a 100-kΩ resistor in series with the pins.
- (3) The TPA3110D2 incorporates an exposed thermal pad on the underside of the chip. This acts as a heatsink, and it must be connected to a thermally dissipating plane for proper power dissipation. Failure to do so may result in the device going into thermal protection shutdown. See TI Technical Briefs [SLMA002](#) for more information about using the TSSOP thermal pad.

7.2 ESD Ratings

| | | VALUE | UNIT |
|--------------------|-------------------------|--|-------|
| V _(ESD) | Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾ | ±2000 |
| | | Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾ | ±500 |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

| | | MIN | MAX | UNIT |
|-----------------|--------------------------------|--|-----|------|
| V _{CC} | Supply voltage | PV _{CC} , AV _{CC} | | V |
| V _{IH} | High-level input voltage | \overline{SD} , GAIN0, GAIN1, PBTL | | V |
| V _{IL} | Low-level input voltage | \overline{SD} , GAIN0, GAIN1, PBTL | | 0.8 |
| V _{OL} | Low-level output voltage | \overline{FAULT} , R _{PULL-UP} = 100 k, V _{CC} = 26 V | | 0.8 |
| I _{IH} | High-level input current | \overline{SD} , GAIN0, GAIN1, PBTL, V _I = 2 V, V _{CC} = 18 V | | 50 |
| I _{IL} | Low-level input current | \overline{SD} , GAIN0, GAIN1, PBTL, V _I = 0.8 V, V _{CC} = 18 V | | 5 |
| T _A | Operating free-air temperature | -40 | 85 | °C |

7.4 Thermal Information

| THERMAL METRIC ⁽¹⁾ | | TPA3110D2 | UNIT |
|-------------------------------|--|--------------|------|
| | | PWP (HTSSOP) | |
| | | 28 PINS | |
| R _{θJA} | Junction-to-ambient thermal resistance | 30.3 | °C/W |
| R _{θJC(top)} | Junction-to-case (top) thermal resistance | 33.5 | °C/W |
| R _{θJB} | Junction-to-board thermal resistance | 17.5 | °C/W |
| ψ _{JT} | Junction-to-top characterization parameter | 0.9 | °C/W |
| ψ _{JB} | Junction-to-board characterization parameter | 7.2 | °C/W |
| R _{θJC(bot)} | Junction-to-case (bottom) thermal resistance | 0.9 | °C/W |

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

7.5 DC Characteristics: 24 V

T_A = 25°C, V_{CC} = 24 V, R_L = 8 Ω (unless otherwise noted)

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT | |

- (2) Related parameters of the two-layer EVM: copper thickness of top layer and bottom layer are both 0.03556mm.

8 Parameter Measurement Information

All parameters are measured according to the conditions described in the [Specifications](#) section.

9 Detailed Description

9.1 Overview

The TPA3110D2 is a 15-W Class-D audio power amplifier. It is designed to drive BTL stereo speakers. This device is able to use inexpensive ferrite bead filters at the outputs while meeting EMC requirements. The TPA3110D2 can drive stereo speakers as low as 4 Ω and its high efficiency eliminates the need for an external heat sink. The device is fully protected against shorts to GND, VCC and output-to-output. The short-circuit protection and thermal protection includes an auto-recovery feature.

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 TPA3110D2 Modulation Scheme

The TPA3110D2 uses a modulation scheme that allows operation without the classic LC reconstruction filter when the amp is driving an inductive load. Each output is switching from 0 volts to the supply voltage. The OUTP and OUTN are in phase with each other with no input so that there is little or no current in the speaker. The duty cycle of OUTP is greater than 50% and OUTN is less than 50% for positive output voltages. The duty cycle of OUTP is less than 50% and OUTN is greater than 50% for negative output voltages. The voltage across the load sits at 0V throughout most of the switching period, reducing the switching current, which reduces any I^2R losses in the load.

Figure 36. The TPA3110D2 Output Voltage And Current Waveforms Into An Inductive Load

9.3.1.1 Ferrite Bead Filter Considerations

Using the Advanced Emissions Suppression Technology in the TPA3110D2 amplifier it is possible to design a high efficiency Class-D audio amplifier while minimizing interference to surrounding circuits. It is also possible to accomplish this with only a low-cost ferrite bead filter. In this case it is necessary to carefully select the ferrite bead used in the filter.

One important aspect of the ferrite bead selection is the type of material used in the ferrite bead. Not all ferrite material is alike, so it is important to select a material that is effective in the 10 to 100 MHz range which is key to the operation of the Class D amplifier. Many of the specifications regulating consumer electronics have emissions limits as low as 30 MHz. It is important to use the ferrite bead filter to block radiation in the 30 MHz and above range from appearing on the speaker wires and the power supply lines which are good antennas for these signals. The impedance of the ferrite bead can be used along with a small capacitor with a value in the range of 1000 pF to reduce the frequency spectrum of the signal to an acceptable level. For best performance, the resonant frequency of the ferrite bead/ capacitor filter should be less than 10 MHz.

Feature Description (continued)

Also, it is important that the ferrite bead is large enough to maintain its impedance at the peak currents expected for the amplifier. Some ferrite bead manufacturers specify the bead impedance at a variety of current levels. In this case it is possible to make sure the ferrite bead maintains an adequate amount of impedance at the peak current the amplifier will see. If these specifications are not available, it is also possible to estimate the bead current handling capability by measuring the resonant frequency of the filter output at low power and at maximum power. A change of resonant frequency of less than fifty percent under this condition is desirable. Examples of ferrite beads which have been tested and work well with the TPA3110D2 include 28L0138-80R-10 and HI1812V101R-10 from Steward and the 742792510 from Würth Electronics.

A high quality ceramic capacitor is also needed for the ferrite bead filter. A low ESR capacitor with good temperature and voltage characteristics will work best.

Additional EMC improvements may be obtained by adding snubber networks from each of the class D outputs to ground. Suggested values for a simple RC series snubber network would be 10 Ω in series with a 330 pF capacitor although design of the snubber network is specific to every application and must be designed taking into account the parasitic reactance of the printed circuit board as well as the audio amp. Take care to evaluate the stress on the component in the snubber network especially if the amp is running at high PVCC. Also, make sure the layout of the snubber network is tight and returns directly to the PGND or the PowerPAD™ beneath the chip.

Figure 37. TPA3110D2 EMC Spectrum With FCC Class B Limits

9.3.1.2 Efficiency: LC Filter Required With The Traditional Class-D Modulation Scheme

The main reason that the traditional class-D amplifier needs an output filter is that the switching waveform results in maximum current flow. This causes more loss in the load, which causes lower efficiency. The ripple current is large for the traditional modulation scheme, because the ripple current is proportional to voltage multiplied by the time at that voltage. The differential voltage swing is $2 \times V_{CC}$, and the time at each voltage is half the period for the traditional modulation scheme. An ideal LC filter is needed to store the ripple current from each half cycle for the next half cycle, while any resistance causes power dissipation. The speaker is both resistive and reactive, whereas an LC filter is almost purely reactive.

The TPA3110D2 modulation scheme has little loss in the load without a filter because the pulses are short and the change in voltage is V_{CC} instead of $2 \times V_{CC}$. As the output power increases, the pulses widen, making the ripple current larger. Ripple current could be filtered with an LC filter for increased efficiency, but for most applications the filter is not needed.

An LC filter with a cutoff frequency less than the class-D switching frequency allows the switching current to flow through the filter instead of the load. The filter has less resistance but higher impedance at the switching frequency than the speaker, which results in less power dissipation, therefore increasing efficiency.

Feature Description (continued)

9.3.1.3 When to Use an Output Filter for EMI Suppression

The TPA3110D2 has been tested with a simple ferrite bead filter for a variety of applications including long speaker wires up to 125 cm and high power. The TPA3110D2 EVM passes FCC Class B specifications under these conditions using twisted speaker wires. The size and type of ferrite bead can be selected to meet application requirements. Also, the filter capacitor can be increased if necessary with some impact on efficiency.

There may be a few circuit instances where it is necessary to add a complete LC reconstruction filter. These circumstances might occur if there are nearby circuits which are sensitive to noise. In these cases a classic second order Butterworth filter similar to those shown in the figures below can be used.

Some systems have little power supply decoupling from the AC line but are also subject to line conducted interference (LCI) regulations. These include systems powered by "wall warts" and "power bricks." In these cases, LC reconstruction filters can be the lowest cost means to pass LCI tests. Common mode chokes using low frequency ferrite material can also be effective at preventing line conducted interference.

Figure 38. Typical LC Output Filter, Cutoff Frequency of 27 KHz, Speaker Impedance = 8 Ω

Figure 39. Typical Lc Output Filter, Cutoff Frequency Of 27 KHz, Speaker Impedance = 4 Ω

Figure 40. Typical Ferrite Chip Bead Filter (Chip Bead Example)

9.3.2 Gain Setting Via GAIN0 And GAIN1 Inputs

The gain of the TPA3110D2 is set by two input terminals, GAIN0 and GAIN1. The voltage slew rate of these gain terminals, along with terminals 1 and 14, must be restricted to no more than 10V/ms. For higher slew rates, use a 100kΩ resistor in series with the terminals.

Feature Description (continued)

The gains listed in Table 2 are realized by changing the taps on the input resistors and feedback resistors inside the amplifier. This causes the input impedance (Z_i) to be dependent on the gain setting. The actual gain settings are controlled by ratios of resistors, so the gain variation from part-to-part is small. However, the input impedance from part-to-part at the same gain may shift by $\pm 20\%$ due to shifts in the actual resistance of the input resistors.

For design purposes, the input network (discussed in the next section) should be designed assuming an input impedance of 7.2 k Ω , which is the absolute minimum input impedance of the TPA3110D2. At the lower gain settings, the input impedance could increase as high as 72 k Ω

Table 2. Gain Setting

| GAIN1 | GAIN0 | AMPLIFIER GAIN (dB) | INPUT IMPEDANCE (k Ω) |
|-------|-------|---------------------|-------------------------------|
| | | TYP | TYP |
| 0 | 0 | 20 | 60 |
| 0 | 1 | 26 | 30 |
| 1 | 0 | 32 | 15 |
| 1 | 1 | 36 | 9 |

9.3.3 Differential Inputs

The differential input stage of the amplifier cancels any noise that appears on both input lines of the channel. To use the TPA3110D2 with a differential source, connect the positive lead of the audio source to the INP input and the negative lead from the audio source to the INN input. To use the TPA3110D2 with a single-ended source, ac ground the INP or INN input through a capacitor equal in value to the input capacitor on INN or INP and apply the audio source to either input. In a single-ended input application, the unused input should be ac grounded at the audio source instead of at the device input for best noise performance. For good transient performance, the impedance seen at each of the two differential inputs should be the same.

The impedance seen at the inputs should be limited to an RC time constant of 1 ms or less if possible. This is to allow the input dc blocking capacitors to become completely charged during the 14 ms power-up time. If the input capacitors are not allowed to completely charge, there will be some additional sensitivity to component matching which can result in pop if the input components are not well matched.

9.3.4 PLIMIT

The voltage at pin 10 can be used to limit the power to levels below that which is possible based on the supply rail. Add a resistor divider from GVDD to ground to set the voltage at the PLIMIT pin. An external reference may also be used if tighter tolerance is required. Also add a 1 μ F capacitor from pin 10 to ground.

Figure 41. PLIMIT Circuit Operation

The PLIMIT circuit sets a limit on the output peak-to-peak voltage. The limiting is done by limiting the duty cycle to fixed maximum value. This limit can be thought of as a *virtual* voltage rail which is lower than the supply connected to PVCC. This "virtual" rail is 4 times the voltage at the PLIMIT pin. This output voltage can be used to calculate the maximum output power for a given maximum input voltage and speaker impedance.

$$P_{OUT} = \frac{\left(\left(\frac{R_L}{R_L + 2 \times R_S} \right) \times V_P \right)^2}{2 \times R_L} \quad \text{for unclipped power}$$

Where:

- R_S is the total series resistance including $R_{DS(on)}$, and any resistance in the output filter.
- R_L is the load resistance.
- V_P is the peak amplitude of the output possible within the supply rail.
- $P_{OUT} (10\%THD) = 1.25 \times P_{OUT} (\text{unclipped})$ (1)

Table 3. PLIMIT Typical Operation

| TEST CONDITIONS | PLIMIT VOLTAGE | OUTPUT POWER (W) | OUTPUT VOLTAGE AMPLITUDE (V_{P-P}) |
|--|----------------|--------------------------|--|
| PVCC=24V, V_{in} =1Vrms, R_L =8 Ω , Gain=26dB | 6.97 | 36.1 (thermally limited) | 43 |
| PVCC=24V, V_{in} =1Vrms, R_L =8 Ω , Gain=26dB | 2.94 | 15 | 25.2 |
| PVCC=24V, V_{in} =1Vrms, R_L =8 Ω , Gain=26dB | 2.34 | 10 | 20 |
| PVCC=24V, V_{in} =1Vrms, R_L =8 Ω , Gain=26dB | 1.62 | 5 | 14 |
| PVCC=24V, V_{in} =1Vrms, R_L =8 Ω , Gain=20dB | 6.97 | 12.1 | 27.7 |
| PVCC=24V, V_{in} =1Vrms, R_L =8 Ω , Gain=20dB | 3.00 | 10 | 23 |
| PVCC=24V, V_{in} =1Vrms, R_L =8 Ω , Gain=20dB | 1.86 | 5 | 14.8 |
| PVCC=12V, V_{in} =1Vrms, R_L =8 Ω , Gain=20dB | 6.97 | 10.55 | 23.5 |
| PVCC=12V, V_{in} =1Vrms, R_L =8 Ω , Gain=20dB | 1.76 | 5 | 15 |

9.3.5 GVDD Supply

The GVDD Supply is used to power the gates of the output full bridge transistors. It can also be used to supply the PLIMIT voltage divider circuit. Add a 1- μ F capacitor to ground at this pin.

9.3.6 PBTL Select

TPA3110D2 offers the feature of parallel BTL operation with two outputs of each channel connected directly. If the PBTL pin (pin 14) is tied high, the positive and negative outputs of each channel (left and right) are synchronized and in phase. To operate in this PBTL (mono) mode, apply the input signal to the RIGHT input and place the speaker between the LEFT and RIGHT outputs. Connect the positive and negative output together for best efficiency. The voltage slew rate of the PBTL pin must be restricted to no more than 10V/ms. For higher slew rates, use a 100k Ω resistor in series with the terminals. For an example of the PBTL connection, see the schematic in the APPLICATION INFORMATION section.

For normal BTL operation, connect the PBTL pin to local ground.

9.3.7 Thermal Protection

Thermal protection on the TPA3110D2 prevents damage to the device when the internal die temperature exceeds 150°C. There is a $\pm 15^\circ\text{C}$ tolerance on this trip point from device to device. Once the die temperature exceeds the thermal set point, the device enters into the shutdown state and the outputs are disabled. This is not a latched fault. The thermal fault is cleared once the temperature of the die is reduced by 15°C. The device begins normal operation at this point with no external system interaction.

Thermal protection faults are NOT reported on the $\overline{\text{FAULT}}$ terminal.

9.3.8 DC Detect

TPA3110D2 has circuitry which will protect the speakers from DC current which might occur due to defective capacitors on the input or shorts on the printed circuit board at the inputs. A DC detect fault will be reported on the $\overline{\text{FAULT}}$ pin as a low state. The DC Detect fault will also cause the amplifier to shutdown by changing the state of the outputs to Hi-Z. To clear the DC Detect it is necessary to cycle the PVCC supply. Cycling $\overline{\text{SD}}$ will NOT clear a DC detect fault.

A DC Detect Fault is issued when the output differential duty-cycle of either channel exceeds 14% (for example, +57%, -43%) for more than 420 msec at the same polarity. This feature protects the speaker from large DC currents or AC currents less than 2Hz. To avoid nuisance faults due to the DC detect circuit, hold the $\overline{\text{SD}}$ pin low at power-up until the signals at the inputs are stable. Also, take care to match the impedance seen at the positive and negative inputs to avoid nuisance DC detect faults.

The minimum differential input voltages required to trigger the DC detect are show in table 2. The inputs must remain at or above the voltage listed in the table for more than 420 msec to trigger the DC detect.

Table 4. DC Detect Threshold

| AV(dB) | V _{in} (mV, differential) |
|--------|------------------------------------|
| 20 | 112 |
| 26 | 56 |
| 32 | 28 |
| 36 | 17 |

9.3.9 Short-Circuit Protection and Automatic Recovery Feature

TPA3110D2 has protection from overcurrent conditions caused by a short circuit on the output stage. The short circuit protection fault is reported on the $\overline{\text{FAULT}}$ pin as a low state. The amplifier outputs are switched to a Hi-Z state when the short circuit protection latch is engaged. The latch can be cleared by cycling the $\overline{\text{SD}}$ pin through the low state.

If automatic recovery from the short circuit protection latch is desired, connect the $\overline{\text{FAULT}}$ pin directly to the $\overline{\text{SD}}$ pin. This allows the $\overline{\text{FAULT}}$ pin function to automatically drive the $\overline{\text{SD}}$ pin low which clears the short-circuit protection latch.

9.4 Device Functional Modes

9.4.1 $\overline{\text{SD}}$ Operation

The TPA3110D2 employs a shutdown mode of operation designed to reduce supply current (I_{CC}) to the absolute minimum level during periods of nonuse for power conservation. The $\overline{\text{SD}}$ input terminal should be held high (see specification table for trip point) during normal operation when the amplifier is in use. Pulling $\overline{\text{SD}}$ low causes the outputs to mute and the amplifier to enter a low-current state. Never leave $\overline{\text{SD}}$ unconnected, because amplifier operation would be unpredictable.

For the best power-off pop performance, place the amplifier in the shutdown mode prior to removing the power supply voltage.

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

This section describes a stereo BTL application and a mono PBTL application. In the stereo application the Power Limiter is implemented, however in the mono application this limiter is not used.

10.2 Typical Applications

10.2.1 Stereo Class-D Amplifier With BTL Output and Single-Ended Inputs With Power Limiting

Figure 42. Typical Application Schematic With BTL Output and Single-Ended Inputs With Power Limiting

Typical Applications (continued)

10.2.1.1 Design Requirements

For this design example, use the parameters listed in [Table 5](#).

Table 5. Design Parameters

| DESIGN PARAMETER | EXAMPLE VALUE |
|-----------------------------------|---------------|
| Power supply | 8 V to 26 V |
| Shutdown, gain, and PBTL controls | High > 2 V |
| | Low < 0.8 V |
| Speaker impedance BTL | 4 to 8 Ω |
| Speaker impedance PBTL | 2 to 8 Ω |

10.2.1.2 Detailed Design Procedure

10.2.1.2.1 Input Resistance

Changing the gain setting can vary the input resistance of the amplifier from its smallest value, 9 kΩ ±20%, to the largest value, 60 kΩ ±20%. As a result, if a single capacitor is used in the input high-pass filter, the –3 dB or cutoff frequency may change when changing gain steps.

Figure 43. Input Impedance of the TPA3110D2

The –3-dB frequency can be calculated using [Equation 2](#). Use the Zi values given in [Table 2](#).

$$f = \frac{1}{2\pi Z_i C_i} \tag{2}$$

10.2.1.2.2 Input Capacitor, Ci

In the typical application, an input capacitor (Ci) is required to allow the amplifier to bias the input signal to the proper dc level for optimum operation. In this case, Ci and the input impedance of the amplifier (Zi) form a high-pass filter with the corner frequency determined in [Equation 3](#).

The value of Ci is important, as it directly affects the bass (low-frequency) performance of the circuit. Consider the example where Zi is 60 kΩ and the specification calls for a flat bass response down to 20 Hz. [Equation 3](#) is reconfigured as [Equation 4](#).

$$C_i = \frac{1}{2\pi Z_i f_c} \tag{4}$$

In this example, C_1 is $0.13 \mu\text{F}$; so, one would likely choose a value of $0.15 \mu\text{F}$ as this value is commonly used. If the gain is known and is constant, use Z_1 from Table 2 to calculate C_1 . A further consideration for this capacitor is the leakage path from the input source through the input network (C_1) and the feedback network to the load. This leakage current creates a dc offset voltage at the input to the amplifier that reduces useful headroom, especially in high gain applications. For this reason, a low-leakage tantalum or ceramic capacitor is the best choice. When polarized capacitors are used, the positive side of the capacitor should face the amplifier input in most applications as the dc level there is held at 3 V, which is likely higher than the source dc level. Note that it is important to confirm the capacitor polarity in the application. Additionally, lead-free solder can create dc offset voltages and it is important to ensure that boards are cleaned properly.

10.2.1.2.3 BSN and BSP Capacitors

The full H-bridge output stages use only NMOS transistors. Therefore, they require bootstrap capacitors for the high side of each output to turn on correctly. A $0.22 \mu\text{F}$ ceramic capacitor, rated for at least 25 V, must be connected from each output to its corresponding bootstrap input. Specifically, one $0.22 \mu\text{F}$ capacitor must be connected from OUTPx to BSPx, and one $0.22 \mu\text{F}$ capacitor must be connected from OUTNx to BSNx. (See the application circuit diagram in Figure 42.)

The bootstrap capacitors connected between the BSxx pins and corresponding output function as a floating power supply for the high-side N-channel power MOSFET gate drive circuitry. During each high-side switching cycle, the bootstrap capacitors hold the gate-to-source voltage high enough to keep the high-side MOSFETs turned on.

10.2.1.2.4 Using Low-ESR Capacitors

Low-ESR capacitors are recommended throughout this application section. A real (as opposed to ideal) capacitor can be modeled simply as a resistor in series with an ideal capacitor. The voltage drop across this resistor minimizes the beneficial effects of the capacitor in the circuit. The lower the equivalent value of this resistance, the more the real capacitor behaves like an ideal capacitor.

10.2.1.3 Application Curves

10.2.2 Stereo Class-D Amplifier With PBTL Output and Single-Ended Input

(1) 100 kΩ resistor is needed if the PVCC slew rate is more than 10 V/ms.

10.2.2.3 Application Curve

Note: Dashed Lines represent thermally limited regions.

Figure 47. Output Power vs Supply Voltage (PBTl)

11 Power Supply Recommendations

The TPA3110D2 is designed to operate from an input voltage supply range between 8-V and 26-V. Therefore, the output voltage range of power supply should be within this range and well regulated. The current capability of upper power should not exceed the maximum current limit of the power switch.

11.1 Power Supply Decoupling, C_S

The TPA3110D2 is a high-performance CMOS audio amplifier that requires adequate power supply decoupling to ensure that the output total harmonic distortion (THD) is as low as possible. Power supply decoupling also prevents oscillations for long lead lengths between the amplifier and the speaker. Optimum decoupling is achieved by using a network of capacitors of different types that target specific types of noise on the power supply leads. For higher frequency transients due to parasitic circuit elements such as bond wire and copper trace inductances as well as lead frame capacitance, a good quality low equivalent-series-resistance (ESR) ceramic capacitor of value between 220 pF and 1000 pF works well. This capacitor should be placed as close to the device PVCC pins and system ground (either PGND pins or PowerPAD™) as possible.

For mid-frequency noise due to filter resonances or PWM switching transients as well as digital hash on the line, another good quality capacitor typically 0.1 μF to 1 μF placed as close as possible to the device PVCC leads works best. For filtering lower frequency noise signals, a larger aluminum electrolytic capacitor of 220 μF or greater placed near the audio power amplifier is recommended.

The 220-μF capacitor also serves as a local storage capacitor for supplying current during large signal transients on the amplifier outputs. The PVCC terminals provide the power to the output transistors, so a 220 μF or larger capacitor should be placed on each PVCC terminal. A 10-μF capacitor on the AVCC terminal is adequate. Also, a small decoupling resistor between AVCC and PVCC can be used to keep high frequency class D noise from entering the linear input amplifiers.

12 Layout

12.1 Layout Guidelines

The TPA3110D2 can be used with a small, inexpensive ferrite bead output filter for most applications. However, since the Class-D switching edges are fast, it is necessary to take care when planning the layout of the printed circuit board. The following suggestions will help to meet EMC requirements.

- Decoupling capacitors—The high-frequency decoupling capacitors should be placed as close to the PVCC and AVCC terminals as possible. Large (220 μF or greater) bulk power supply decoupling capacitors should be placed near the TPA3110D2 on the PVCC and PVCCR supplies. Local, high-frequency bypass capacitors should be placed as close to the PVCC pins as possible. These caps can be connected to the thermal pad directly for an excellent ground connection. Consider adding a small, good quality low ESR

Layout Guidelines (continued)

- ceramic capacitor between 220 pF and 1000 pF and a larger mid-frequency cap of value between 0.1 μF and 1 μF also of good quality to the PVCC connections at each end of the chip.
- Keep the current loop from each of the outputs through the ferrite bead and the small filter cap and back to PGND as small and tight as possible. The size of this current loop determines its effectiveness as an antenna.
- Grounding—The AVCC (pin 7) decoupling capacitor should be grounded to analog ground (AGND). The PVCC decoupling capacitors should connect to PGND. Analog ground and power ground should be connected at the thermal pad, which should be used as a central ground connection or star ground for the TPA3110D2.
- Output filter—The ferrite EMI filter (Figure 40) should be placed as close to the output terminals as possible for the best EMI performance. The LC filter (Figure 38 and Figure 39) should be placed close to the outputs. The capacitors used in both the ferrite and LC filters should be grounded to power ground.
- Thermal Pad—The thermal pad must be soldered to the PCB for proper thermal performance and optimal reliability. The dimensions of the thermal pad and thermal land should be 6.46mm by 2.35mm. Seven rows of solid vias (three vias per row, 0,3302 mm or 13 mils diameter) should be equally spaced underneath the thermal land. The vias should connect to a solid copper plane, either on an internal layer or on the bottom layer of the PCB. The vias must be solid vias, not thermal relief or webbed vias. See the TI Application Report SLMA002 for more information about using the TSSOP thermal pad. For recommended PCB footprints, see figures at the end of this data sheet.

For an example layout, see the TPA3110D2 Evaluation Module (TPA3110D2EVM) User Manual. Both the EVM user manual and the thermal pad application report are available on the TI Web site at www.ti.com.

14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

| Orderable part number | Status (1) | Material type (2) | Package Pins | Package qty Carrier | RoHS (3) | Lead finish/ Ball material (4) | MSL rating/ Peak reflow (5) | Op temp (°C) | Part marking (6) |
|-------------------------------|---------------|----------------------|-------------------|-----------------------|-------------|--------------------------------------|-----------------------------------|--------------|---------------------|
| TPA3110D2PWP | Active | Production | HTSSOP (PWP) 28 | 50 TUBE | Yes | NIPDAU | Level-3-260C-168 HR | -40 to 85 | TPA3110D2 |
| TPA3110D2PWPR | Active | Production | HTSSOP (PWP) 28 | 2000 LARGE T&R | Yes | NIPDAU | Level-3-260C-168 HR | -40 to 85 | TPA3110D2 |

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#) or other applicable terms available either on [ti.com](https://www.ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
