

LM2903-Q1 和 LM2903B-Q1 汽车类双路比较器

特性

- 符合汽车应用要求
- 具有符合 AEC-Q100 标准的下列特性：
 - 器件温度等级 0：-40°C 至 150°C 的环境工作温度范围 (LM2903E-Q1)
 - 器件温度等级 1：-40°C 至 125°C 环境工作温度范围
 - 器件 HBM ESD 分类等级 H1C
 - 器件 CDM ESD 分类等级 C4B
- 改进了“B”器件的 2kV HBM ESD
- 可用于“B”器件的 Tri-Temp 测试
- 单电源或双电源
- 独立于电源电压的低电源电流：
每个比较器 200uA (典型值) (“B”版本)
- 低输入偏置电流：3.5nA (典型值) (“B”器件)
- 低输入偏置电流：0.5nA (典型值) (“B”器件)
- 低输入偏移电压：±0.37mV (典型值) (“B”器件)
- 共模输入电压范围包括接地
- 差动输入电压范围等于最大额定电源电压：±36V
- 输出与 TTL、MOS 和 CMOS 兼容
- 功能安全型
 - 可提供用于功能安全系统设计的文档

应用

- 汽车
 - HEV/EV 和动力总成
 - 信息娱乐系统与仪表组
 - 车身控制模块
- 工业
- 电器

说明

LM2903B-Q1 器件是业界通用 LM2903-Q1 比较器系列的下一代版本。该下一代系列为成本敏感型应用提供了卓越的价值，其特性包括更低的失调电压、更高的电源电压能力、更低的电源电流、更低的输入偏置电流、更低的传播延迟以及更高的 2kV ESD 性能，并提供了直接替代的便利性。

所有器件都包含两个独立的电压比较器，这些比较器可在广泛的电压范围内运行。如果两个电源的电压差处于 2V 至 36V 范围内且 VCC 比输入共模电压至少高 1.5V，那么也可以使用双电源。输出可以连接到其他集电极开路输出。

LM2903-Q1 和 LM2903B-Q1 符合 -40°C 至 +125°C 的 AEC-Q100 1 级温度范围。LM2903E-Q1 符合 -40°C 至 +150°C 的 0 级工作温度范围。

3 Detailed Description

3.1 Overview

The LM2903-Q1 family is a dual comparator with the ability to operate up to 36V on the supply pin. This standard device has proven ubiquity and versatility across a wide range of applications. This is due to its very wide supply voltages range (2V to 36V), low I_q and fast response.

This device is AEC-Q100 qualified and can operate over a wide temperature range of -40°C to 125°C (LM2903-Q1 and LM2903B-Q1) or -40°C to 150°C (LM2903E-Q1).

The open-drain output allows the user to configure the output's logic low voltage (V_{OL}) and can be utilized to enable the comparator to be used in AND functionality.

The "B" versions add dedicated ESD protections on all the pins for improved ESD performance as well as improved negative input voltage handling. Please see Application Note [SNOAA35](#) for more information

3.2 Functional Block Diagram

图 3-1. Schematic (Each Comparator)

3.3 Feature Description

LM2903-Q1 family consists of a PNP darlington pair input, allowing the device to operate with very high gain and fast response with minimal input bias current. The input Darlington pair creates a limit on the input common mode voltage capability, allowing LM2903-Q1 to accurately function from ground to $V_{CC} - 1.5\text{V}$ differential input. This enables much head room for modern day supplies of 3.3V and 5.0V. A clamp (Q15) was added around Q3 to force the output low when both inputs are taken above the VCM range.

The output consists of an open drain NPN (pull-down or low side) transistor. The output NPN sinks current when the negative input voltage is higher than the positive input voltage and the offset voltage. The V_{OL} is resistive and scales with the output current. Please see [Output Low Voltage vs. Output Sinking Current at 5V](#) in the [Typical Characteristics](#) section for V_{OL} values with respect to the output current.

3.4 Device Functional Modes

3.4.1 Voltage Comparison

The LM2903-Q1 family operates solely as a voltage comparator, comparing the differential voltage between the positive and negative pins and outputting a logic low or high impedance (logic high with pull-up) based on the input differential polarity.

4 Application and Implementation

备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

4.1 Application Information

LM2903-Q1 will typically be used to compare a single signal to a reference or two signals against each other. Many users take advantage of the open drain output to drive the comparison logic output to a logic voltage level to an MCU or logic device. The wide supply range and high voltage capability makes LM2903Q1 optimal for level shifting to a higher or lower voltage.

4.2 Typical Application

图 4-1. Single-ended and Differential Comparator Configurations

4.2.1 Design Requirements

For this design example, use the parameters listed in 表 4-1 as the input parameters.

表 4-1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input Voltage Range	0V to Vsup-1.5V
Supply Voltage	2V to 36V
Logic Supply Voltage	2V to 36V
Output Current (Rpullup)	1μA to 20mA
Input Overdrive Voltage	100mV
Reference Voltage	2.5V
Load Capacitance (CL)	15pF

4.2.2 Detailed Design Procedure

When using LM2903-Q1 family in a general comparator application, determine the following:

- Input Voltage Range
- Minimum Overdrive Voltage
- Output and Drive Current
- Response Time

4.2.2.1 Input Voltage Range

When choosing the input voltage range, the input common mode voltage range (V_{ICR}) must be taken in to account. If temperature operation is above or below 25°C the V_{ICR} can range from 0V to $V_{CC} - 2V$. This limits the input voltage range to as high as $V_{CC} - 2.0V$ and as low as 0V. Operation outside of this range can yield incorrect comparisons.

Below is a list of input voltage situation and the outcomes:

1. When both IN- and IN+ are both within the common mode range:
 - a. If IN- is higher than IN+ and the offset voltage, the output is low and the output transistor is sinking current
 - b. If IN- is lower than IN+ and the offset voltage, the output is high impedance and the output transistor is not conducting
2. When IN- is higher than common mode and IN+ is within common mode, the output is low and the output transistor is sinking current
3. When IN+ is higher than common mode and IN- is within common mode, the output is high impedance and the output transistor is not conducting
4. When IN- and IN+ are both higher than common mode, see Section 2 of [Application Design Guidelines for LM339, LM393, TL331 Family Comparators Including the New B-versions](#)

4.2.2.2 Minimum Overdrive Voltage

Overdrive Voltage is the differential voltage produced between the positive and negative inputs of the comparator over the offset voltage (V_{IO}). To make an accurate comparison the Overdrive Voltage (V_{OD}) must be higher than the input offset voltage (V_{IO}). Overdrive voltage can also determine the response time of the comparator, with the response time decreasing with increasing overdrive. 图 4-2 and 图 4-3 show positive and negative response times with respect to overdrive voltage.

4.2.2.3 Output and Drive Current

Output current is determined by the load/pull-up resistance and logic/pull-up voltage. The output current produces a output low voltage (V_{OL}) from the comparator. In which V_{OL} is proportional to the output current. Use 图 2-21 to determine V_{OL} based on the output current.

The output current can also effect the transient response. More explanation is in the next section.

4.2.2.4 Response Time

The transient response can be determined by the load capacitance (C_L), load/pull-up resistance (R_{PULLUP}) and equivalent collector-emitter resistance (R_{CE}).

- The positive response time (τ_P) is approximately $\tau_P = R_{PULLUP} \times C_L$
- The negative response time (τ_N) is approximately $\tau_N = R_{CE} \times C_L$
 - R_{CE} can be determine by taking the slope of 图 2-21 in it's linear region at the desired temperature, or by dividing the V_{OL} by I_{out}

4.2.3 Application Curves

The following curves were generated with 5V on V_{CC} and V_{Logic} , $R_{PULLUP} = 5.1k\Omega$, and 50pF scope probe.

图 4-2. Response Time for Various Overdrives
(Positive Transition)

图 4-3. Response Time for Various Overdrives
(Negative Transition)

4.3 Power Supply Recommendations

A bypass capacitor is recommended on the supply pin to reject any variation on the supply voltage. This variation can eat into the comparator's input common mode range and create an inaccurate comparison.

4.4 Layout

4.4.1 Layout Guidelines

For accurate comparator applications without hysteresis, a stable power supply with minimal noise must be maintained. To achieve this, the best practice is to add a bypass capacitor between the supply voltage and ground. This can be implemented on the positive power supply and negative supply (if available). If a negative supply is not being used, do not put a capacitor between the IC's GND pin and system ground.

5.5 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

NOTES:

PowerPAD is a trademark of Texas Instruments.

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-187.

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
9. Size of metal pad may vary due to creepage requirement.
